What changed in version 2.1

Version 2.0 described the marketplace as charging sellers a listing fee, and described every purchase as being paid in EURO. Both have changed, and this paper is the corrected record.

Basic listing is now free. The liquidity stream it was intended to fund is replaced, in full, by featured placement revenue and by the sale commission.

Settlement is now tiered. Everyday purchases are paid in EURO. Large purchases are paid in a stable asset so that a single transaction cannot move the EURO market against the person making it. **The marketplace commission is always taken in EURO, on every sale, at every size**, so real trade continues to buy EURO on the open market and lock it.

Section 9 carries the detail. No token fact has changed: supply, the burn, renounced ownership and disabled minting are exactly as stated in version 2.0 and remain verifiable on Basescan.

1 Abstract

EURO (ticker: EUR) is a decentralized, community owned utility token on the Base network, an Ethereum Layer 2. It exists for one stubborn idea: that ordinary people deserve a form of money they truly control, one that cannot be quietly inflated, frozen, paused, or rewritten by anyone, including its own creators.

There was no ICO and no presale. EURO launched directly onto decentralized exchanges, with the community adding liquidity in the open and locking it on UNCX. The original supply of 8,000,000 has since been reduced by a permanent burn of 6,000,000 tokens, leaving a fixed maximum of 2,000,000. The contract has no function to mint, no function to pause or freeze, and no blacklist, and its ownership has been renounced. What you hold, you hold.

EURO is not a stablecoin and it is not pegged. Its strength is meant to come from a permanently locked pool of liquidity that deepens over time as the community grows, and from real products where the token is actually used. This paper explains the idea, the constraints written into the code, the corrected tokenomics after the burn, the ecosystem being built, how to acquire and store EURO, and the risks you must understand before you ever participate.

2 The promise of money

Cryptocurrency began as a promise. That value could move without a gatekeeper's permission. That no central authority could debase your savings overnight. That the rules would be open for anyone to read and impossible for anyone to bend. Somewhere along the way much of that promise was sold off. Tokens launched with secret allocations, teams promised decentralization and then changed the rules whenever it suited them, and freedom became a slogan on a billboard rather than a property of the code.

EURO is a deliberate return to the original idea. It is not affiliated with the European Union, the European Central Bank, any government, or any bank. The name refers to this project only. Everything that follows is designed so you never have to trust a personality, only verify the code.

3 The principles we will never break

Most projects publish values. We publish constraints, things the smart contract itself makes impossible. These are not marketing lines, they are properties you can verify on Basescan today.

- **No minting.** There is no function to create new EURO. The supply can only stay the same or shrink through burning. The slow printing of money that erodes savings in the traditional world is simply not possible here.
- **No pausing, no freezing, no blacklist.** The contract cannot halt trading or freeze a wallet. No one can stop you from moving what is yours.
- **No hidden transfer tax.** Buying and selling EURO does not route a secret fee to anyone.
- **No holder lockups.** When you acquire EURO on the open market it is immediately and fully yours.
- **Ownership renounced.** The owner is now the zero address, so no administrative function can ever be called again. A promise can be broken. Absent code cannot.

4 A fixed, shrinking supply

Scarcity is the whole philosophy. EURO began with 8,000,000 tokens. On 10 July 2026 the community permanently burned 6,000,000 of them, 75 percent of the entire supply, sending them to an address no one can ever open. That leaves a fixed maximum of 2,000,000 EURO. Because the contract cannot mint, this number can only ever fall further as more tokens are burned over time. Every burn is public and verifiable on Basescan.

5 Why Base

EURO settles on Base, an Ethereum Layer 2 secured by Ethereum itself. The choice was deliberate.

- **Security.** Base inherits the guarantees of Ethereum, one of the most decentralized and battle tested networks in existence.
- **Low fees.** Transactions on Base typically cost a fraction of a cent, so the network is usable by everyone, not only the wealthy.
- **Clean by design.** EURO requires no mining and no energy hungry hardware. Base runs on proof of stake infrastructure, making EURO an environmentally responsible asset. Freedom should not cost the planet.

6 The fair launch

EURO had no private sale, no presale, no insider round, and no allocation sold to funds before the public could buy. It launched directly onto decentralized exchanges, in the open, where the first buyer and the thousandth buyer play by exactly the same rules.

The community adds liquidity to the market and locks it on UNCX. Locked liquidity means the pool that lets people trade cannot be pulled out from under the market, the single most common way holders get hurt in this industry. We chose the opposite of the exit scam playbook: show up, add depth, and lock it away on chain.

7 Tokenomics after the burn

The figures below reflect the live on chain state and supersede any earlier numbers. They are verifiable on Base today.

- **Total supply:** 2,000,000 EURO, a fixed maximum, after 6,000,000 were permanently burned from the original 8,000,000.
- **Circulating supply:** about 1,200,000 EURO.
- **Team allocation:** 800,000 EURO. Because the burn came from the market float while the team allocation stayed locked, this now represents about 40 percent of the reduced 2,000,000 supply, rather than the 10 percent of the original 8,000,000. It remains locked for ten years on UNCX and releases evenly at 80,000 per year, with no cliffs and no early unlocks.
- **Ownership:** renounced. The owner is the zero address, so the token is fully trustless.
- **Minting:** disabled. Supply can only fall.

A team that can dump has every incentive to. By stretching the team allocation across ten equal yearly steps and locking it publicly on UNCX, contributors are tied to the long term health of the project rather than a quick payday. Anyone can see every token, every lock, and every release on chain, without our permission.

8 The EUROFI model: liquidity that grows

This is what makes EURO different from an ordinary stablecoin. A typical stablecoin sits still. It promises one euro and returns one euro, while a bank you cannot see holds the difference. EURO takes the opposite path. It is not pegged and it is not parked in someone else's vault. It is anchored by real liquidity that lives on the blockchain, locked in public on UNCX for ten years or more, and designed to deepen over time.

The mechanism is a simple, honest loop. Trading activity and community growth feed the locked liquidity behind EURO, so the floor beneath the token grows rather than drains away. Fees earned by the marketplace and by the community exchange are directed back into that locked liquidity. The larger the community becomes, the more liquidity is locked, and the stronger and more trusted the currency grows. More people, more depth, more trust.

We describe this as a goal and a design, never a guaranteed price. No honest team can promise a number. What we can promise, and what you can verify, is that liquidity is being added and locked, that the supply can only shrink, and that the rules cannot be changed.

9 Real world utility: the EURO economy

A currency is only real when you can spend it, so EURO is being built for the real world.

The EURO marketplace

The community is building an open marketplace where anyone can list what they sell, from electronics and food to gold and collectibles, and be paid for it. **Opening a shop and listing an item are free.** There is no gatekeeper in the middle and no border deciding who is allowed to trade. Trades settle through an on chain escrow contract, so a buyer's money is only released to the seller when the deal completes.

How payment works. Prices are shown in a familiar unit so buyers and sellers always know what a thing costs. Everyday purchases are paid directly in EURO. Larger purchases are paid in a stable asset instead, for a simple reason: EURO has a fixed supply of 2,000,000, so a single very large order paid entirely in EURO would move the market against the person placing it. Rather than pretend otherwise, the marketplace routes large orders around that problem, and the threshold at which it does so rises automatically as the locked liquidity behind EURO deepens.

The commission is always taken in EURO. On every completed sale, at every size, the marketplace commission is bought in EURO on the open market and 40 percent of it is added to locked liquidity, with the rest going to the referrer who introduced the sale and to the treasury. Sellers who want to be paid in EURO can choose to be. This means real trade creates real, continuous EURO demand, without asking anyone to spend an asset they would rather hold.

What comes later. Vehicles and property are planned for later phases, once the locked liquidity behind EURO is deep enough to support transactions of that size and the licensed local partners required for those categories are in place. We would rather tell you the order of the roadmap than advertise something we cannot deliver today.

A community owned exchange

EUROFI intends to operate its own decentralized exchange. A DEX is a public utility: it lets people swap assets without an intermediary. When people trade, the exchange earns ordinary trading fees, and those fees give the community a sustainable engine to keep deepening the locked liquidity behind EURO. This is utility funding stability, not a scheme promising a yield.

In every case the principle is the same. Build things people actually use, so the relevance of the token is earned through utility, never manufactured through manipulation. The team does not engage in fake market making, wash trading, or price influence of any kind.

10 Privacy, self custody and responsible freedom

EURO puts you back in control of your own money. You hold your own keys and you transact directly, wallet to wallet, without a company sitting between you and your funds. Because ownership is renounced and the contract has no freeze or blacklist, no central party can seize or pause what is in your wallet. This is censorship resistance as a property of the code, not a marketing claim.

Financial privacy and self custody are core to what crypto was always meant to be. With that freedom comes responsibility. We ask every holder to use EURO lawfully and to respect the rules that apply where they live. EURO is a tool for ownership and open commerce, not a tool for evading the law.

11 The community

The EUROFI community lives at community.eurofi.org, on infrastructure the community controls, designed to be the opposite of a scam ridden chat group.

- No private messages exist, by design, so the most common scam, a fake admin in your DMs, is impossible here.
- The team carries a verified badge, so official voices cannot be impersonated.
- No censorship of honest opinion. You may speak freely, glowing or harshly critical. Only scams, spam, and abuse are removed.
- A holders area for verified EURO holders, alongside open areas anyone can join.

To join, open community.eurofi.org and create an account with an email or connect your wallet. To unlock the holders area, connect a wallet that holds EURO and the platform confirms your balance on chain. There is no application and no gatekeeper. The team behind EUROFI is anonymous by design: you are asked to judge the project by its code and its locks, not by faces on a page.

12 How to acquire and store EURO

Step 1: prepare a wallet on Base

Use any self custodial wallet that supports Base, such as MetaMask, Trust Wallet, or Coinbase Wallet. If Base is not present, add it with network name Base, RPC URL https://mainnet.base.org, chain ID 8453, currency symbol ETH, and explorer https://basescan.org. Fund it with a small amount of ETH on Base for fees, usually only cents.

Step 2: swap for EURO

Go to a DEX that supports Base, such as Uniswap or the OKX on chain swap, connect your wallet, and paste the official EURO contract address. Always confirm it matches the address in this paper, character for character. Choose the amount and confirm. You can also view the live market on GeckoTerminal.

Step 3: add the token

If EURO does not appear automatically, import it as a custom token using the contract address. The symbol (EUR) and 18 decimals will fill in automatically.

13 Token specification

Network	Base (Ethereum Layer 2), chain ID 8453
Token standard	ERC 20
Symbol	EUR
Decimals	18
Original supply	8,000,000 EURO (6,000,000 burned, 75%)
Total supply	2,000,000 EURO (fixed maximum)
Circulating supply	about 1,200,000 EURO
Minting	Disabled, no mint function exists
Pause / freeze / blacklist	None
Transfer tax	None
Token burn	Supported
Ownership	Renounced (owner is the zero address)
Team allocation	800,000 EURO (40% of current supply), locked 10 years on UNCX, 80,000 per year
Team lock proof	`0x7ca3de7d58a0bcad1151845975534 85a919320c5`
Liquidity	Locked on UNCX (Uniswap v4 EUR/ETH and EUR/USDC)
Liquidity lock proof	`0xff908ded2a6c68226d3f834b25d803a815bdb28b`
Contract	`0x832BCceD5bD431b31663576490344EA1c0Bea295`
Verify	Source verified on Basescan

Because EURO is source verified, anyone can read the exact contract on Basescan and confirm every claim in this paper. We ask you to do exactly that. Trust the code, not us.

14 Legal notice and risk disclosure

Please read this carefully. EURO is a decentralized community utility token. It is not affiliated with, endorsed by, or connected to the European Central Bank, the European Union, or the euro currency, and the name refers to this project only. EURO is not a stablecoin, not electronic money, not a deposit, not a security, not a share, not a fund, and not an investment contract. It is not pegged and carries no guarantee of value or return.

Nothing in this document is an offer to sell or a solicitation to buy any instrument, and nothing here is financial, legal, investment, or tax advice. EURO confers no ownership, equity, dividend, interest, or claim on any entity, and no team offers its efforts as a source of profit to holders. Any utility described exists to be used, not to generate a passive return.

Products described in this paper, including the marketplace and the exchange, are under development. Features, phasing and mechanics may change as they are built and audited, and nothing here is a commitment to deliver a specific feature on a specific date. Smart contracts are described as audited only once an independent audit report exists.

Digital assets are highly volatile and you may lose the entire value of what you commit. Holders are solely responsible for complying with the laws and tax rules of their own jurisdiction, and for determining whether they are permitted to hold or use EURO where they live. Always do your own research.

15 Together we grow

This was never about getting rich quickly. It was about building one honest thing in an industry that badly needs it: a token no one can inflate, no one can freeze, and no one can secretly control, owned by a community that is finally allowed to speak freely.

We cannot promise you a number, and we never will. What we can promise is that we will not change the rules, will not manipulate the market, will not censor your voice, and will not disappear. We will keep showing up, keep building, and keep locking liquidity, alongside you, as part of the same community.

Together we grow. Together we are free.
